

INFORMATION ABOUT .RFA FILES

1. The .RFA files delivered by Minotti SpA are in the 2018 version.
2. Unit of measurement: metric.
3. The .RFA files delivered by Minotti SpA are not technical executive files; they provide visual rendering of the product to be used as part of Revit projects.
4. To upload all "types" of product in the Revit project file, upload the .RFA file from: "carica famiglia" ["upload family"] or "carica nel progetto" ["upload in the project"].
5. The families may include differently sized "types".
6. The "Dati Identità" ["Identity Data"] include information about the product. The "Element Code" fields include product codes.
7. Note on right and left-hand elements: the specularity derives from a left/right check; therefore the "Element code" field includes the dual code (e.g.: FRDET112S-FRDET112D); when drafting a quantitative chart we recommend adding manually in the "comments" field the words DX or SX (DX =right; SX=left) as in the note: Left/Right note.
9. Rendering: the files are set with some finishings to be render-ready; they may, however, be customized with product finishings available in the product sheet on the minotti.com website. Upholstered products have been set with the texture "Pumice Aspen Leather" available from the minotti.com website; however, they may be customized also referring to the product sheet available on the minotti.com website.
10. In some cases the .zip file contains textures which help characterize the product.

IMPORTANT

1. All materials and finishings are indicative; please always refer to the product sheet available on the minotti.com website.
2. Made to measure: for customized elements, please contact info@minotti.it.
3. None of the information in the .RFA may be altered in any way.
